Section 1 : Coding

1. Problem Statement

Ravi is developing a student registration system for a college. To efficiently store and manage the student IDs, he decides to implement a doubly linked list where each node represents a student's ID.

In this system, each student's ID is stored sequentially, and the system needs to display all registered student IDs in the order they were entered.

Implement a program that creates a doubly linked list, inserts student IDs, and displays them in the same order.

Input Format

The first line contains an integer N the number of student IDs.

The second line contains N space-separated integers representing the student IDs.

Output Format

The output should display the single line containing N space-separated integers representing the student IDs stored in the doubly linked list.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 20 30 40 50
Output: 10 20 30 40 50

Answer

```c
#include<stdio.h>
#include<stdlib.h>
struct Node{
    int data;
    struct Node*next;
    struct Node*prev;

};
void insertend(struct Node** head,int data){
    struct Node*newNode=(struct Node*)malloc(sizeof(struct Node));
    newNode->data=data;
    newNode->next=NULL;
    if(*head==NULL){
        newNode->prev=NULL;
        *head=newNode;
        return;
    }
    struct Node*temp=*head;
    while(temp->next!=NULL){
        temp=temp->next;
    }
    temp->next=newNode;
    newNode->prev=temp;
}
```

```c
void dl(struct Node*head){
    struct Node*temp=head;
    while(temp!=NULL){
        printf("%d",temp->data);
        temp=temp->next;
    }
    printf("\n");
}
int main(){
    int n,id;
    struct Node*head=NULL;
    scanf("%d",&n);
    for(int i=0;i<n;i++){
        scanf("%d",&id);
        insertend(&head, id);
    }
    dl(head);
    return 0;
}
```

Status : Correct   *Marks : 10/10*
